\* third crop sire

### Abbreviations

**GW%** = Group winners to runners percentage  
**SW%** = Stakes winners to runners percentage

**AWD** = average winning distance (in furlongs)

### Mare quality

**AEI** is the average earnings index for the offspring by subject stallion. The median earnings being 1.00, with figures above 1.00 being above the average. The **C-AEI** is the comparative index for all the offspring from the same mares but by different stallions. If the AEI is higher than the C-AEI it means that the stallion is upgrading his mares. *High earning horses can prejudice this figure.*

### APEX ratings

The **Apex**-ratings is a measure of earnings over the last seven years. The “A-Apex” horses are the top 2% of earners; “B-Apex” the next 2% just below. The ABC-Apex includes all horses that are in the top 8% earning category. APEX figures are determined by calculating the frequency with which a sire gets runners in the top 2% (“A”), 4% (“B”) and 8% (“C”) of earners.

This measurement does not allow a high earning horse to distort the figures, as is possible for the AEI.

*However, these statistics cover the last 7 years only, so ageing and less fashionable stallions that progressively cover weaker mares see declines in their Apex ratings as the early crops [from better mares] are dropped from their figures. Also the figures are annual and not lifetime for individual horses. So these statistics have a bias towards younger stallions and also the ‘elite’ stallions – supported by better mares. Nevertheless they are interesting.*

APEX ratings are not provided for first-season-sires. It should also be noted that *second season sires generally have disproportionately high APEX ratings*, that subsequently decline. Except for top stallions; younger sires will generally have runners from better mares in their early crops.
